Environmental Protection Agency

- (iii) C_3H_8 , balance purified synthetic air and/or N_2 (as applicable).
 - (iv) CO, balance purified N2.
 - (v) CO_2 , balance purified N_2 .
 - (vi) NO, balance purified N_2 .
- (vii) NO_2 , balance purified synthetic air.
- (viii) O_2 , balance purified N_2 .
- (ix) C_3H_8 , CO, $\overrightarrow{CO_2}$, NO, balance purified N_2 .
- (x) C_3H_8 , CH_4 , CO, CO_2 , NO, balance purified N_2 .
- (xi) N_2O , balance purified synthetic air and/or N_2 (as applicable).
- (4) You may use gases for species other than those listed in paragraph (a)(3) of this section (such as methanol in air, which you may use to determine response factors), as long as they are traceable to within ±3% of the NIST-accepted value or other similar standards we approve, and meet the stability requirements of paragraph (b) of this section.
- (5) You may generate your own calibration gases using a precision blending device, such as a gas divider, to dilute gases with purified N_2 or purified synthetic air. If your gas dividers meet the specifications in $\S 1065.248$, and the gases being blended meet the requirements of paragraphs (a)(1) and (3) of this section, the resulting blends are considered to meet the requirements of this paragraph (a).
- (b) Record the concentration of any calibration gas standard and its expiration date specified by the gas supplier.
- (1) Do not use any calibration gas standard after its expiration date, except as allowed by paragraph (b)(2) of this section.
- (2) Calibration gases may be relabeled and used after their expiration date as follows:
- (i) Alcohol/carbonyl calibration gases used to determine response factors according to subpart I of this part may be relabeled as specified in subpart I of this part.
- (ii) Other gases may be relabeled and used after the expiration date only if we approve it in advance.
- (c) Transfer gases from their source to analyzers using components that are dedicated to controlling and transferring only those gases. For example, do not use a regulator, valve, or transfer line for zero gas if those components

were previously used to transfer a different gas mixture. We recommend that you label regulators, valves, and transfer lines to prevent contamination. Note that even small traces of a gas mixture in the dead volume of a regulator, valve, or transfer line can diffuse upstream into a high-pressure volume of gas, which would contaminate the entire high-pressure gas source, such as a compressed-gas cylinder.

(d) To maintain stability and purity of gas standards, use good engineering judgment and follow the gas standard supplier's recommendations for storing and handling zero, span, and calibration gases. For example, it may be necessary to store bottles of condensable gases in a heated environment.

§ 1065.790 Mass standards.

- (a) PM balance calibration weights. Use PM balance calibration weights that are certified as NIST-traceable within 0.1% uncertainty. Calibration weights may be certified by any calibration lab that maintains NIST-traceability. Make sure your highest calibration weight has no greater than ten times the mass of an unused PM-sample medium.
- (b) $Dynamometer\ calibration\ weights.$ [Reserved]

Subpart I—Testing With Oxygenated Fuels

§ 1065.801 Applicability.

(a) This subpart applies for testing with oxygenated fuels. Unless the standard-setting part specifies otherwise, the requirements of this subpart do not apply for fuels that contain less than 25% oxygenated compounds by volume. For example, you generally do not need to follow the requirements of this subpart for tests performed using a fuel containing 10% ethanol and 90% gasoline, but you must follow these requirements for tests performed using a
